(with the kind support of
Rosalba Rossato)

Outline

- · What is a Data Warehouse
- Data Warehouse Architecture
- · Data Warehouse Design

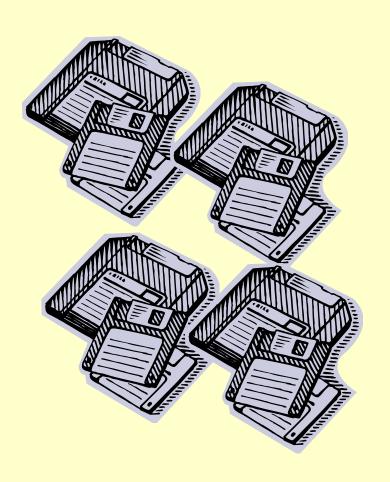

Analysis of data (from Wikipedia)

- <u>Data analysis</u> is a process of inspecting, cleaning, transforming, and modeling <u>data</u> with the goal of highlighting useful <u>information</u>, suggesting conclusions, and supporting decision making.
- Data analysis has multiple facets and approaches, encompassing diverse techniques under a variety of names, in different business, science, and social science domains.
- <u>Data mining</u> is a particular data analysis technique that focuses on modeling and knowledge discovery for predictive rather than purely descriptive purposes.
- <u>Business intelligence</u> covers data analysis that relies heavily on <u>aggregation</u>, focusing on business information.

What is a Data Warehouse

- Data should be <u>integrated across the</u> <u>enterprise(s)</u>
- <u>Summary data</u> provide real value to the organization
- Historical data hold the key to understanding data over time
- · What-if capabilities are required

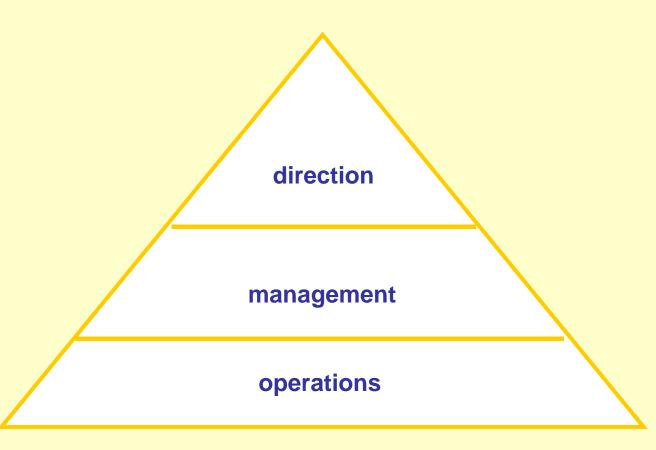

What is a Data Warehouse?

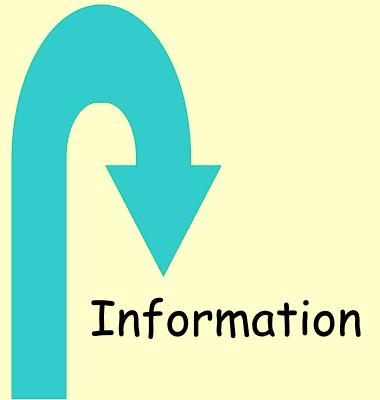

A single, complete and consistent store of data obtained from a variety of different sources made available to end users, so that they can understand and use it in a business context.

[Barry Devlin]

Business Processes' Pyramid

An alternative definition of Data Warehouse

A data warehouse is (the result of) a process for transforming data into information and for making it available to users in a timely enough manner to make a difference.

Data

[Forrester Research, April'96]

Data Warehouse

- As a dataset: decision support database maintained separately from the organization's operational database
- As a process: technique for assembling and managing data from various sources with the purpose of answering business questions. Thus making decisions that were not previously possible

Data Warehouse

- · A Data Warehouse is a
 - subject-oriented,
 - integrated,
 - time-varying,
 - non-volatile

collection of data that is used primarily in organizational decision making.

[Bill Inmon, Building the Data Warehouse, 1996]

Dimensions of a Data Warehouse

- Data warehouses are <u>very</u> large databases
 - o Terabytes (10¹² bytes):
 - o Petabytes (1015 bytes): e.g. Geographic Information Systems
 - o Exabytes (1018 bytes): e.g. National Medical Records
 - o Zettabytes (10²¹ bytes): e.g. Weather reports, including images
 - o Zottabytes (10²⁴ bytes): e.g. Intelligence Agency Videos

DW is a specialized DB

Standard DB (OLTP)

- Mostly updates
- Many small transactions
- · Mb Gb of data
- Current snapshot
- Index/hash on p.k.
- Raw data
- Thousands of users
 (e.g., clerical users)

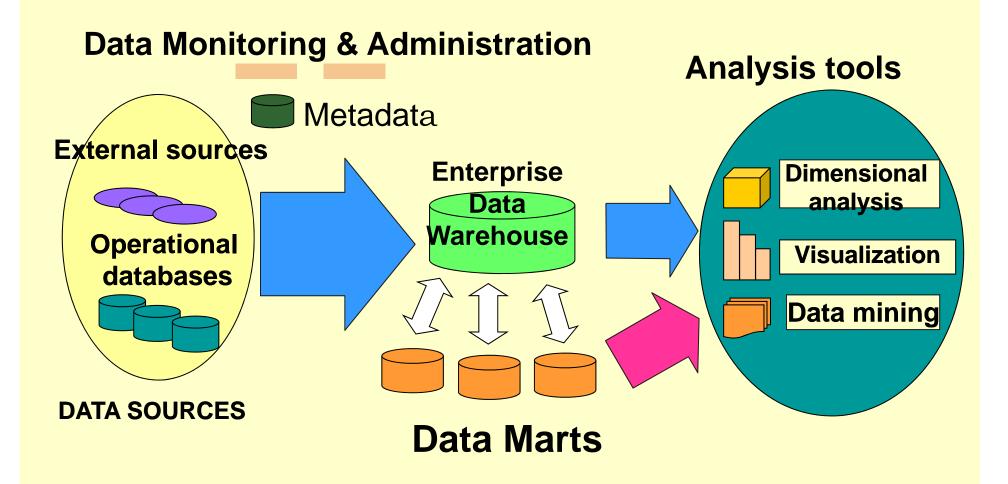

Warehouse (OLAP)

- Mostly reads
- Queries are long and complex
- · Gb Tb of data
- History
- Lots of scans
- Summarized, reconciled data
- Hundreds of users

Where is a DW useful

- Commerce: sales and complaints analysis, client fidelization, shipping and stock control
- Manufacturing plants: production cost control, provision and order support
- Financial services: risk and credit card analysis, fraud detection
- Telecommunications: call flow analysis, subscribers' profiles
- Healthcare structures: patients' ingoing and outgoing flows, cost analysis

Architecture for a data warehouse

OLAP-oriented data models

- must support sophisticated analyses and computations over different dimensions and hierarchies
- Most appropriate data model: data cube
- Cube dimensions are the search keys
- · Each dimension may be hierarchical
 - DATE {DAY-MONTH-TRIMESTER-YEAR}
 - PRODUCT {BRAND TYPE CATEGORY}

(e.g. LAND ROVER - CARS - VEHICLES)

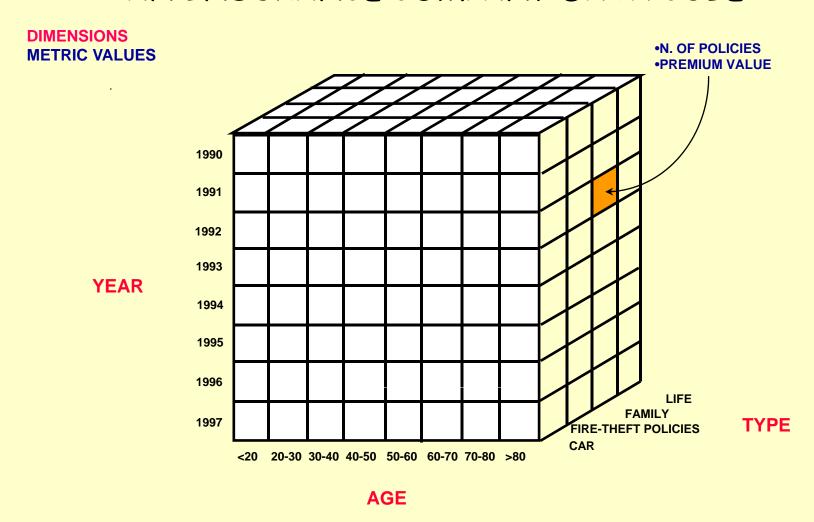

· Cube cells contain metric values

Examples of data warehouse queries

- Show total sales across all products at increasing aggregation levels for a geography dimension, from state to country to region, for 1999 and 2000.
- Create a cross-tabular analysis of our operations showing expenses by territory in South America for 1999 and 2000. Include all possible subtotals.
- List the top 10 sales representatives in Asia according to sales revenue for automotive products in year 2000, and rank their commissions.

LOGICAL MODELS FOR OLAP

AN INSURANCE COMPANY DATA CUBE

Dimensional Fact Model

- Allows one to describe a set of fact schemata
- The components of a fact schema are:
 - Facts
 - Measures
 - Dimensions
 - Dimension Hierarchy

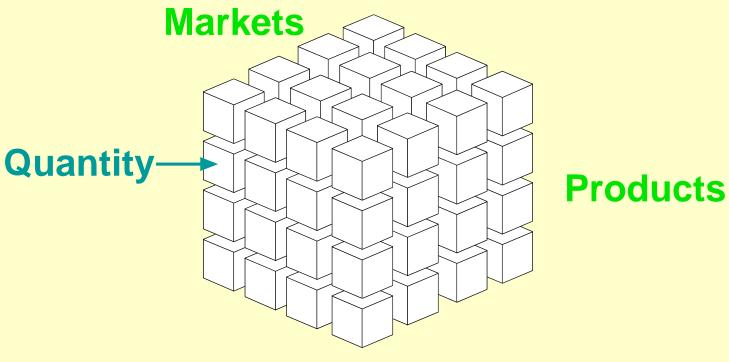

DFM: elements

- A fact is a concept that is relevant for the decisional process; typically it models a set of events of the organization
- A measure is a numerical property of a fact
- A dimension is a fact property defined w.r.t. a finite domain; it describes an analysis coordinate for the fact

Examples

- · Store chain
 - Fact: sales
 - Measures: sold quantity, gross income
 - Dimensions: product, time, zone
- · Telecom Operator
 - Fact: phone call
 - Measures: cost, duration
 - Dimensions: caller subscriber, called subscriber, time

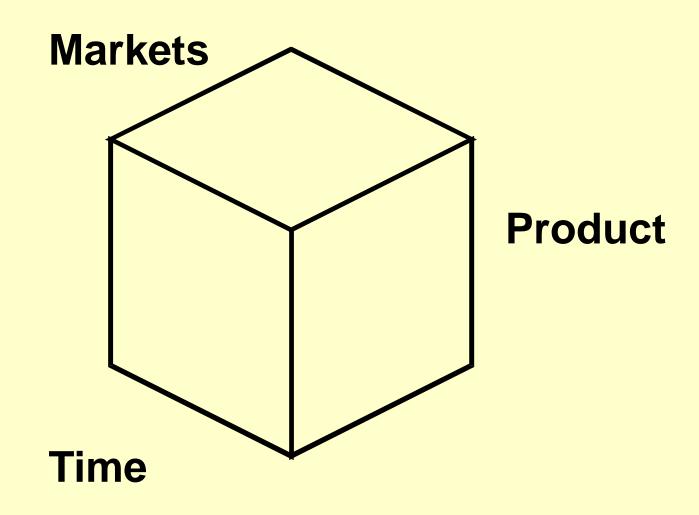

Multidimensional Representation

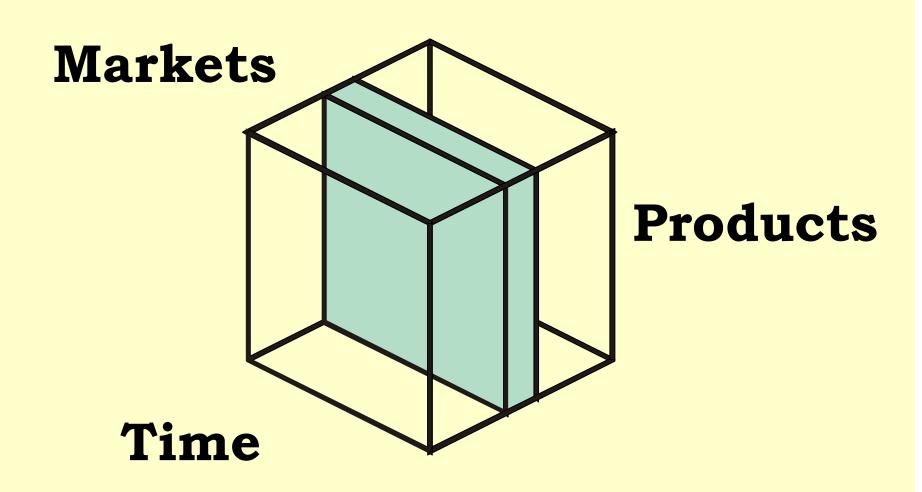

Time Periods

Sales Cube

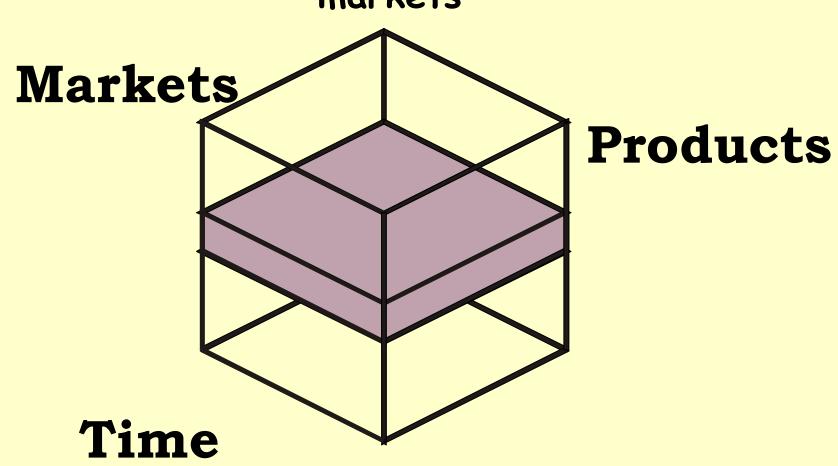

Multidimensional data views

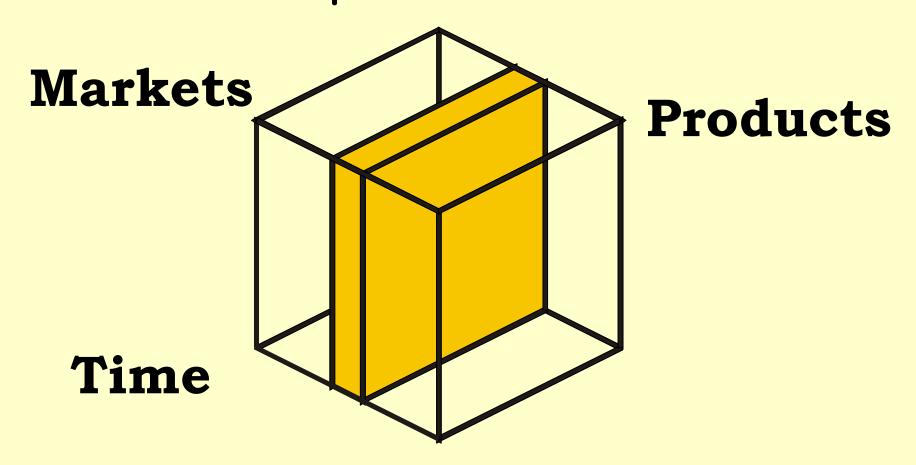

The area manager examines product sales of his/her own markets

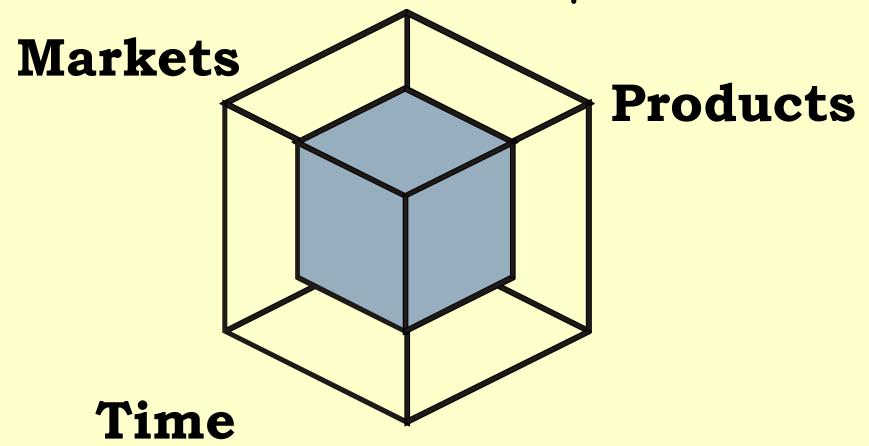

Product manager examines the sales of a specific product in all periods and in all markets

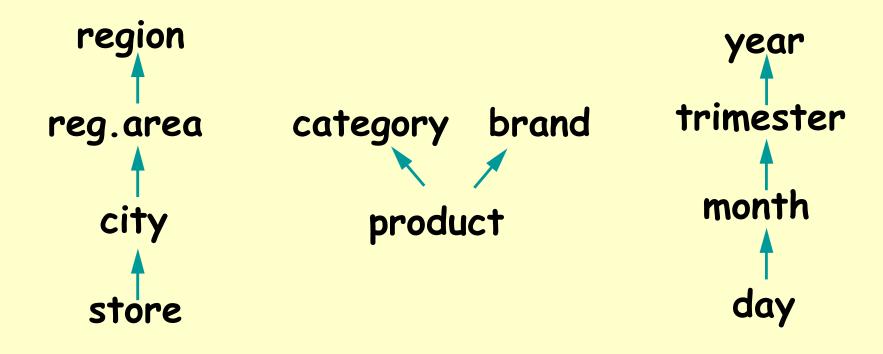

Financial manager examines product sales in all markets, for the current period and the previous one

The strategic manager concentrates on a category of products, a specific region and a medium time span

Dimensions and hierarchies

OLAP OPERATIONS

· roll-up

- Aggregates data at a higher level - e.g. last year's sales volume per product category and per region

· drill-down

- De-aggregates data at the lower level - e.g. for a given product category and a given region, show daily sales

· slice-and-dice

- Applies selections and projections, which reduce data dimensionality

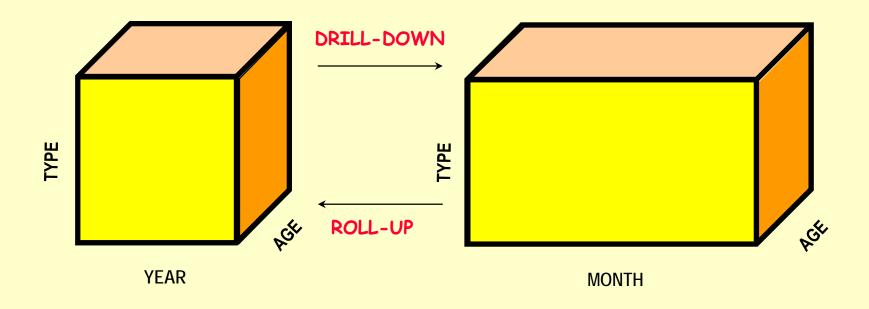

pivoting

- Selects two dimensions to re-aggregate data (cube re-orientation)

· ranking

- Sorts data according to predefined criteria
- traditional operations (select, project, join, derived attributes, etc.)

OLAP OPERATIONS

Roll-up

VISUALIZATION and REPORTS

Data may be visualized graphically, in an Excel-like format: tables, hystograms, graphics, 3D surfaces, etc.

incassi (K€)	Ottobre 2001	Settembre 2001	Agosto 2001
Abbigliamento	80	100	50
Alimentari	20	40	10
Arredamento	50	5	10
Profumeria	25	35	20
Pulizia casa	15	20	5
Tempo libero	60	50	20

Examples of operators: initial table

month	product	Sales am. t	Quantity
February	pasta	130.000.000	45.000
March	pasta	140.000.000	50.000
April	pasta	135.000.000	51.000
-	·		

Drill-down: adding a dimension

Drill-down on the zone

month	product	zone	quantity
February	pasta	north	15.000
February	pasta	east	17.000
February	pasta	center	13.000
March	pasta	north	18.000
March	pasta	east	18.000
March	pasta	center	14.000
April	pasta	north	18.000
April	pasta	east	17.000
April	pasta	center	16.000

Roll-up: dimension elimination

Roll-up on the month

	- 0.00	Quantity
product	zone	Qualitity
pasta	north	51.000
pasta	east	52.000
pasta	center	43.000

Aggregate Queries

Examples:

- Total sales per product category, per supermarket, per day
- Total monthly sales for all the products, per supermarket
- Total monthly sales per category per supermarket
- Avg. monthly sales per category, for all supermarkets

Olap logical models

- MOLAP (Multidimensional On-Line Analytical Processing) stores data by using a multidimensional data structure (a "physical" data cube)
- ROLAP (Relational On-Line Analytical Processing) uses the relational data model to represent multidimensional data

The data cube in SQL

- It expresses all the possible tuple aggregations of a table
- It uses the new polymorphic value ALL

Data cube in SQL (ROLAP)

Relevant Facts

model	year	color	sales
fiat	1994	red	50
fiat	1995	red	85
ford	1994	red	80

All the data in the cube

model	year	color	sum (sales)
fiat	1994	red	50
fiat	1995	red	85
fiat	1994	ALL	50
fiat	1995	ALL	85
fiat	ALL	red	135
fiat	ALL	ALL	135
ford	1994	red	80
ford	1994	ALL	80
ford	ALL	red	80
ford	ALL	ALL	80
ALL	1994	red	130
ALL	1995	red	85
ALL	ALL	red	215
ALL	1994	ALL	130
ALL	1995	ALL	85
ALL	ALL	ALL	215

Roll up

ROLLUP enables a SELECT statement to calculate multiple levels of subtotals across a specified group of dimensions. Utilizing the ROLLUP operator instead of the CUBE operator will eliminate the results that contain a NULL (ALL) in the first column, and aggregations only by year are not computed.

The data after roll-up

model	year	color	sum(sales)
fiat	1994	red	50
fiat	1995	red	85
ford	1994	red	80
fiat	1994	ALL	50
fiat	1995	ALL	85
ford	1994	ALL	80
fiat	ALL	ALL	135
ford	ALL	ALL	80
ALL	ALL	ALL	215

A Simple Cross-Tabular Report With Subtotals

- A database containing: products, customers, sale channels, with the measures amount_sold and quantity_sold.
- Amounts in dollars, aggregated by country, sliced on France and US and the month of September, aggregated by channel
- Half of the values needed for this report would not be calculated just by means of a query that requested SUM(amount_sold) and did a GROUP BY(channel_desc, country_id).

CHANNEL	COUNTRY		
	France	US	Total
Internet	9,597	124,224	133,821
Direct Sales	61,202	638,201	699,403
Total	70,799	762,425	833,224

Cube creation

```
SELECT channels.channel_desc,
  countries.country_iso_code,
  TO_CHAR(SUM(amount_sold), '9,999,999,999')
  SALESS
FROM sales, customers, times, channels, countries
WHERE sales.time_id=times.time_id AND
  sales.cust id=customers.cust id AND
  sales.channel_id= channels.channel_id AND
  channels.channel_desc IN ('Direct Sales',
  'Internet') AND
  times.calendar_month_desc='2000-09' AND
  customers.country_id=countries.country_id AND
  countries.country_iso_code IN ('US','FR')
GROUP BY (channels.channel_desc,
  countries.country iso code)
with CUBE;
```

Resulting table

CHANNEL_DESC	COUNTRY	SALES (\$)
ALL	ALL	833,224
ALL	FR	70,799
ALL	US	762,425
INTERNET	ALL	133,821
INTERNET	FR	9,597
INTERNET	US	124,224
DIRECT SALES	ALL	699,403
DIRECT SALES	FR	61,202
DIRECT SALES	US	638,201

Roll-up query

```
SELECT channels.channel_desc, calendar_month_desc,
  countries.country_iso_code,
  TO_CHAR(SUM(amount_sold), '9,999,999,999')
  SALESS
FROM sales, customers, times, channels, countries
WHERE sales.time_id=times.time_id AND
  sales.cust id=customers.cust id AND
  sales.channel_id= channels.channel_id AND
  channels.channel_desc IN ('Direct Sales',
  'Internet') AND times.calendar month desc IN
  ('2000-09', '2000-10') AND
  countries.country_iso_code IN ('GB', 'US')
GROUP BY (channels.channel_desc,
  calendar_month_desc, countries.country_iso_code)
with ROLLUP;
```

Roll-up result

CHANNEL_DESC	CALENDAR	COUNTRY	SALES\$
INTERNET	2000-09	GB	228,241
INTERNET	2000-09	us	228,241
INTERNET	2000-09	ALL	456,482
INTERNET	2000-10	GB	239,236
INTERNET	2000-10	us	239,236
INTERNET	2000-10	ALL	478,473
INTERNET	ALL	ALL	934,955
DIRECT_SALES	2000-09	GB	1,217,808
DIRECT_SALES	2000-09	บร	1,217,808
DIRECT_SALES	2000-09	ALL	2,435,616
DIRECT_SALES	2000-10	GB	1,225,584
DIRECT_SALES	2000-10	บร	1,225,584
DIRECT_SALES	2000-10	ALL	2,451,169
DIRECT_SALES	ALL	ALL	4,886,784
ALL	ALL	ALL	5,821,739

A ROLL-UP QUERY PRODUCES...

... the following sets of rows:

- Regular aggregation rows that would be produced by GROUP BY without using ROLLUP.
- First-level subtotals aggregating across country_id for each combination of channel_desc and calendar_month.
- Second-level subtotals aggregating across calendar_month_desc and country_id for each channel_desc value.
- A grand total row.

Note that the roll-up operation, unlike the cube, does not produce the rows with the "all" value in the first column (it still retains the row containing all "ALL" values, though)

It is a kind of "progressive aggregation"

Typical DW dimensions

time: 730 days

stock houses: 300

products: 30.000

daily sales: 3.000

promotions: not more than one per product sold

sales: $730 \times 300 \times 3000 \times 1 = 657$ millions.

dimensions: 657 millions x 8 attributes

x 4 byte = 21gb.
